# How to comply with NY-DFS 23 NYCRR Part 500 with Silverfort

WHITEPAPER

# Executive Summary On March 1, 2017, the Department of Financial Services enacted a regulation establishing cybersecurity requirements for financial

services companies, 23 NYCRR Part 500 (referred to below as "Part 500" or "the Cybersecurity Regulation"). As a result of investigating hundreds of cybersecurity incidents, <u>Part 500 was amended</u>, increasing the amount and type of security measures organizations are expected to implement to gain sound cyber resilience. This amendment was effective on November 1, 2023. Addressing the Identity Security Aspects of Part 500

## The steep rise in the use of compromised credentials for malicious access highlights the importance of protecting the identity

attack surface. The amended Part 500 relates to this by requiring comprehensive Multi-Factor Authentication (MFA) and protection for privileged accounts, as well as the implementation of best practices in the monitoring, detection, and response of cyber threats which includes a significant identity protection aspect. Silverfort Unified Identity Security Platform

## The Silverfort platform integrates with an entity's entire Identity and Access Management (IAM) infrastructure to deliver

continuous monitoring, risk analysis, and active enforcement on every authentication and access attempt to any resource. Using these capabilities, Silverfort provides Identity Security Posture Management (ISPM), advanced MFA, service account protection, and Identity Threat Detection and Response (ITDR).

Silverfort for Part 500 Protection Highlights

Extend MFA protection to command-line access, legacy apps, IT infrastructure, and other critical resources that couldn't be protected before.

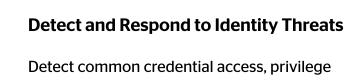

#### Automate the discovery and monitoring of all

service accounts in your environment and enforce auto-created policies to block access if they get compromised.

### Enforce MFA or access block policies on all

your privileged users, both human admins and service accounts.

blocking.

#### Detect common credential access, privilege escalation, and lateral movement attacks, and

respond automatically with real-time

Mapping Silverfort Capabilities to NY-DFS 23 NYCRR Part 500

# 500.2 Cybersecurity program

#### (a) Each covered entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the covered entity's information systems and nonpublic information stored on those information systems.

**NY-DFS Cybersecurity Regulation Silverfort Security Controls** 

<b>(b)</b> The cybersecurity program shall be based on the covered entity's risk assessment and designed to perform the following core cybersecurity functions:	<b>Silverfort continuously monitors</b> the entity's environment to a) disclose identity-related weaknesses and vulnerabilities and b) detect active identity threats.		
(1) identify and assess internal and external cybersecurity risks that may threaten the security or integrity of nonpublic information stored on the covered entity's information systems;	The Silverfort platform provides an automated risk analysis of the protected entity's identity attack surface, including DC misconfigurations, insecure authentication protocols, shadow admins, shared users, unchanged passwords, and other weaknesses that increase the entity's exposure to credential access, privilege escalation, or lateral movement.		
(2) use defensive infrastructure and the implementation of policies and procedures to protect the covered entity's information systems, and the nonpublic information stored on those information systems, from unauthorized access, use or other malicious acts;	The Silverfort platform enables organizations to configure access policies for both on-prem and cloud environments that enforce alerting, MFA, or access block upon insecure authentication to protected systems.		
(3) detect cybersecurity events;	The Silverfort platform includes a risk engine that provides continuous monitoring and risk analysis of every incoming authentication and access attempt. This enables it to detect identity threats, including but not limited to brute force, Pass-theHash, Kerberoasting, and access anomalies that indicate malicious presence and activity within the entity's environment.		
(4) respond to identified or detected cybersecurity events to mitigate any negative effects;	Automated response: the Silverfort platform enables organizations to configure access policies for both on-prem and cloud environments that enforce alerting, request MFA, or block access upon detection of identity threats that were referred to in (3). Manual response: the Silverfort platform provides the SecOps team with detailed log screen that includes the full authentication trail of each user, with risk-related filters to expedite and optimize the process of detecting the user accounts that were compromised during the incident. Moreover, the Silverfort platform policies can be hardened to temporarily reduce overall access and harden authentication requirements to block further lateral movement attempts.		
(5) recover from cybersecurity events and restore normal operations and services; and	N/A		
(6) fulfill applicable regulatory reporting obligations. Design and conduct independent audits of cybersecurity program.	The Silverfort platform enables its users to generate reports periodically or on demand, meeting any auditing requirements that pertain to visibility into user authentication, resource access, and security posture.		

#### information systems. Procedures shall be developed, documented and implemented in accordance with the written policy or policies. The cybersecurity policy or policies and procedures shall be based on the covered entity's risk assessment and address, at a minimum, the following areas to the extent applicable to the covered entity's operations:

**NY-DFS Cybersecurity Regulation** 

(c) Monitor privileged access activity and implement

**NY-DFS Cybersecurity Regulation Silverfort Security Controls** The Silverfort platform is natively integrated with the Identity and Access Management (IAM) solutions in the entity's environment to gain (d) access controls, including remote access and identity management; visibility into and configure access control policies (MFA or access block) for every internal and remote access.

Each covered entity shall implement and maintain a written policy or policies, approved at least annually by a senior officer or the

covered entity's senior governing body for the protection of its information systems and nonpublic information stored on those

500.7(c) Access Privileges
As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.

attack path.

centralized system.

resources they are entitled to.

Silverfort provides organizations with the ability to continuously monitor all privileged access activities and requests for access, enforcing access controls, and

ensuring that only authorized users have access to the

(1) a privileged access management solution	Silverfort enables hospitals to easily manage and control privileged accounts by enforcing least privilege and JIT policies that restrict access functions to only what is necessary for each user's role. Through real-time monitoring and automated policy adjustments, Silverfort can automatically discover and classify the number of privileged accounts in use.
(2) *an automated method of blocking commonly used passwords for all accounts on information systems owned or controlled by the class A company and wherever feasible for all other accounts. *The covered entity's CISO may instead approve in writing at least annually the infeasibility and the use of reasonably equivalent or more secure compensating controls	The Silverfort platform MFA functionality is a reasonably equivalent or more secure compensating control in case the company cannot apply such a solution

### operations related to cybersecurity, nonpublic information collected or stored, information systems utilized and the availability and effectiveness of controls to protect nonpublic information and information systems.

**NY-DFS Cybersecurity Regulation** 

(1) remote access to the covered entity's information systems;

the context of identified risks; and

(b) The risk assessment shall be carried out in accordance with written policies and procedures and shall be documented. Such policies and procedures shall include: The Silverfort platform assigns a risk score to all user (1) criteria for the evaluation and categorization of identified cybersecurity risks or threats facing the accounts and machines within the entity's environment, covered entity; as well as authentications involving these entities. The Silverfort platform provides a Risk Report (2) criteria for the assessment of the confidentiality, integrity, security and availability of the covered functionality that enables organizations to create a entity's information systems and nonpublic information, including the adequacy of existing controls in summary of the entity's identity security posture in a

technological developments and evolving threats and shall consider the particular risks of the covered entity's business

(3) requirements describing how identified risks will be mitigated or accepted based on the risk the mitigation best practice for every detected risk and assessment and how the cybersecurity program will address the risks. the ability to configure an access policy that prevents risky authentications from taking place. 500.12 Multi-Factor Authentication **NY-DFS Cybersecurity Regulation Silverfort Security Controls** The Silverfort platform can enforce MFA protection across all users and resources, on-prem and in the cloud. This (a) Multi-factor authentication shall be utilized for any individual accessing any information systems applies to all Active Directory authentications, including of a covered entity unless the covered entity qualifies for a limited exemption pursuant to section those that couldn't be protected by MFA before, such as 500.19(a) of this Part in which case multi-factor authentication shall be utilized for: legacy applications, command-line access, databases,

(2) remote access to third-party applications, including but not limited to those that are cloud based, from which nonpublic information is accessible; and	any 3rd party application that is accessed onprem or via cloud directory
(3) all privileged accounts other than service accounts that prohibit interactive login	The Silverfort platform automatically detects all privileged users and groups, enabling organizations to easily apply MFA protection to all of them. Additionally, the Silverfort platform automates the discovery, monitoring, and protection of service accounts, with auto-generated access policies that trigger either access block or an alert when a service account's behavior deviates from the norm, which could indicate compromise. This allows privileged service accounts to get the same level of protection as other privileged accounts.  While section (3) excludes "service accounts that prohibit interactive login" from the MFA requirements, it's important to point that in practice, there is no solution that can prevent a person from performing an interactive login with a service account, thereby voiding the above exclusion. However, using the Silverfort platform's autogenerated policies for service account protection, entities can fully mitigate the scenario in which an adversary attempts to leverage a compromised service account's credentials for malicious access to targeted resources.
500.14(b) Monitoring and Training	
Each class A company shall implement, unless the CISO has approved in writing t compensating controls:	he use of reasonably equivalent or more secure
NY-DFS Cybersecurity Regulation	<b>Silverfort Security Controls</b>
	The Silverfort platform monitors all authentications between all endpoints and the other assets of the organization and alerts / deny upon anomalous activity

(2) a solution that centralizes logging and security event alerting

limited to lateral movement;

(1) an endpoint detection and response solution to monitor anomalous activity, including but not

better security outcomes with less work. Discover every identity across every environment,

analyze exposures to reduce your attack surface, and enforce security controls inline to

stop lateral movement, ransomware propagation, and other identity threats.

About Silverfort Silverfort secures every dimension of identity. We are the first to deliver end-to-end identity security across the entire IAM infrastructure, eliminating gaps and blind spots, giving businesses visibility into their identity fabric and extending protection to resources that

previously could not be protected. This is all done via a patented technology that natively integrates with your entire IAM infrastructure, Runtime Access Protection™ (RAP). It is lightweight, easy to use and deploy, and won't disrupt business operations, resulting in
